IDEAL CONCRETE BLOCK COMPANY, INC.

# ScapeStone™ & Olde Boston™ Fire Pits

Today, patios are a part of our lifestyle. They are transitional spaces that extend our family rooms into the outdoors. More than ever, patios are where we entertain our guests, spend time with families, or just get away from it all. Even a simple backyard patio can be a lively gathering spot for relaxation and conversation while sitting around enjoying the warmth and charm of a glowing fire. Our attractive free-standing ScapeStone and Olde Boston fire pit “Block-n-Ring” combinations provide affordable four-season enjoyment just a few steps out your back door!

## Clean and Simple Design

Our “Block-n-Ring” fire pit combinations are compact, solid in construction, and easy to build. There is no guess work! The tapered shape of our ScapeStone units provides the perfect fit with our round rings and our Olde Boston units course out exactly with our square frame. Simply stack the wall style of your choice to the desired height and slide the metal fire ring insert down into the opening – the top of the ring forms a clean edge around the stones and a heavy gauge flange secures the ring within the stones.

## ScapeStone & Olde Boston

Our ScapeStone and Olde Boston units feature our genuine Drum-Roll Tumbled® finish in our attractive Vineyard, Quarry, or Rosewood Blends. ScapeStone is 4”h and 11 pieces are used in each course to form a circle with a 30” inside dimension (44” outside dimension). Each unit weighs approximately 20 lb. Olde Boston is 4”h and 12 pieces are used for each course. Each unit weighs approximately 28 lb.

New! Square fire pit with our Olde Boston™ WallStone

## Fire Pit Rings

We have 3 fire pit ring styles, all with flanges and made of heavy duty steel. Choose from 30” round rings – with or without grates – for ScapeStone, or the 28” square style used with our Olde Boston™ WallStone. The 30” Ring-n-Grate style has 2 heavy steel grates that can be oriented in 3 positions – cantilevered over the fire, slid back, or tilted up and away from the fire.

## Installation

Before you begin, check the building code in your area or with your local fire department. There may be restrictions on open fires or requirements as to where you can place the fire pit in relation to your house or other structures. The fire pit should sit on a firm, non-combustible base, such as 6” of compacted gravel. Dig a hole at the center point approximately 12” wide by 2’ deep and fill it with crushed stone. The hole acts like a sump to drain rainwater, ashes and soot. If building the fire pit on pavers, remove enough pavers to accommodate the sump hole and pitch the remaining pavers towards the center.

Use the ring as a guide to lay out the first course. Place it on the ground and position the units around the frame. Round rings require 11 ScapeStone units to form a tight circle with an inside diameter of 30”. The square ring uses 12 Olde Boston units. Set aside the ring. Adjust and level the block side-to-side and front-to-back. Position the second course by offsetting the joints from the block in the row below. For a uniform inside diameter, plumb the units to the back of the block. Repeat this for the remaining courses until you have reached the desired height. Typical heights are 3 courses (12” high), 4 courses (16” high), 5 courses (20” high), or 6 courses (24” high).

## Finishing

Our CastStone™ Coping provides a beautiful finished look. If using, position each section on the top course, secure it with a few dabs of construction grade adhesive and insert the fire ring. Fill the fire pit with a graded stone or sand to the bottom of the ring inside flange. Reposition stones if needed.

## Enjoy with Fire Safety Sense!

Sitting around a cozy, crackling fire is one of the more enjoyable moments in life, to relax in quiet thought or casual conversation. Keep it that way by following “fire safety sense”! Build only small, controllable fires. While concrete fire pit units do not burn and provide high resistance to heat, concrete can spall if exposed to an intense fire. Never use lighter fluid or gasoline to ignite the wood. Always attend the fire and keep a garden hose nearby in case it needs to be doused quickly. Make sure the fire is completely out prior to leaving the area and have it covered with the grate or screen when left unattended. Never leave children unsupervised around an open flame or hot embers.

*A white deposit known as efflorescence may appear naturally on any concrete or masonry product. It does not effect the structural integrity and will dissipate over time. Efflorescence is not indicative of a flawed product. For more information, ask for Ideal's Efflorescence Advisory.*
